

# TAUOLA, TAUOLA universal interface, PHOTOS and MC-TESTER: Status Report

Z. Wąs

Institute of Nuclear Physics, PAN, Kraków, Poland

- *What is new or important?* **Time limits** → **not a coherent presentation.**
- *especially for interpretators of new experimental data (low and high energy):*
- TAUOLA: extra weights for multidimensional fits with MC. T. Przedzinski, V. Cherepanov, P. Golonka.
- MC-TESTER for automated comparisons and its database, P. Golonka, N. Davidson
- universal interface of TAUOLA: N. Davidson, E. Richter-Was, T. Przedzinski
- PHOTOS for radiative correction in decays: NLO in W-decays. G. Nanava.
- KKMC S. Banerjee, B. Pietrzyk, J.M. Roney non  $\tau$ : MC-TESTER applications
- **Summary**

My web page is at <http://home.cern.ch/wasm>

Z. Was

Novosibirsk, September, 2008

# TAUOLA: basic structure

- Phase space  $\times$  Matrix elements, it is a must
- Electroweak vertex can stay in theorist hands only.
- Semileptonic decays are difficult: **Hadronic current need to remain experiments' property, in cases experiment wish so.**
- The last point enforces constraint for program organization and requests good communication between experimentalists, model builders and TAUOLA authors.
- This topic is being developed now with contributions from Vladimir Cherepanov (Novosibirsk), Tomasz Przedzinski (Krakow) and Piotr Golonka (CERN).
- Larger activity in the near future?
- TMVA Toolkit for Multivariate Data Analysis with ROOT  
<http://tmva.sourceforge.net/> can be useful?
- People (and/or data) from Berlin, Beijing, Charkov, Frascati, Katowice, Karlsruhe, KEK, Novosibirsk, SLAC. Big topic for private discussions (too many directions).

**Semileptonic decays: Phase-space  $\times$  weak-current  $\times$  hadronic-current**

- The differential partial width for the channel under consideration reads

$$d\Gamma_X = G^2 \frac{v^2 + a^2}{4M} d\text{Lips}(P; q_i, N) (\omega + \hat{\omega} + (H_\mu + \hat{H}_\mu) s^\mu)$$

- The phase space distribution is given by the following expression where a compact notation with  $q_5 = N$  and  $q_i^2 = m_i^2$  is used

$$\begin{aligned} d\text{Lips}(P; q_1, q_2, q_3, q_4, q_5) &= \frac{1}{2^{23} \pi^{11}} \int_{Q_{min}^2}^{Q_{max}^2} dQ^2 \int_{Q_{3,min}^2}^{Q_{3,max}^2} dQ_3^2 \\ &\int_{Q_{2,min}^2}^{Q_{2,max}^2} dQ_2^2 \times \int d\Omega_5 \frac{\sqrt{\lambda(M^2, Q^2, m_5^2)}}{M^2} \int d\Omega_4 \frac{\sqrt{\lambda(Q^2, Q_3^2, m_4^2)}}{Q^2} \\ &\times \int d\Omega_3 \frac{\sqrt{\lambda(Q_3^2, Q_2^2, m_3^2)}}{Q_3^2} \int d\Omega_2 \frac{\sqrt{\lambda(Q_2^2, m_2^2, m_1^2)}}{Q_2^2} \\ Q^2 &= (q_1 + q_2 + q_3 + q_4)^2, \quad Q_3^2 = (q_1 + q_2 + q_3)^2, \quad Q_2^2 = (q_1 + q_2)^2 \end{aligned}$$

$$Q_{min} = m_1 + m_2 + m_3 + m_4, \quad Q_{max} = M - m_5 \quad Q_{3,min} = m_1 + m_2 + m_3, \quad Q_{3,max} = Q - m_4$$

$$Q_{2,min} = m_1 + m_2, \quad Q_{2,max} = Q_3 - m_3$$

- These formulas if used directly, are inefficient for a Monte Carlo algorithm if sharp peaks due to resonances in the intermediate states are present. The changes affect the program efficiency, but the actual density of the phase space remains intact. No approximations are introduced.

## General formalism for semileptonic decays

- Matrix element used in TAUOLA for semileptonic decay

$$\tau(P, s) \rightarrow \nu_\tau(N)X$$

$$\mathcal{M} = \frac{G}{\sqrt{2}} \bar{u}(N) \gamma^\mu (v + a\gamma_5) u(P) J_\mu$$

- $J_\mu$  the current depends on the momenta of all hadrons.
- I can provide only prototypes for  $J_\mu$ . Here TAUOLA must be open to experiment interior. difficult in mixed C++ Fortran environment, and of different experiments software.

$$|\mathcal{M}|^2 = G^2 \frac{v^2 + a^2}{2} (\omega + H_\mu s^\mu)$$

$$\omega = P^\mu (\Pi_\mu - \gamma_{va} \Pi_\mu^5), \quad H_\mu = \frac{1}{M} (M^2 \delta_\mu^\nu - P_\mu P^\nu) (\Pi_\nu^5 - \gamma_{va} \Pi_\nu)$$

$$\Pi_\mu = 2[(J^* \cdot N) J_\mu + (J \cdot N) J_\mu^* - (J^* \cdot J) N_\mu]$$

$$\Pi^{5\mu} = 2 \operatorname{Im} \epsilon^{\mu\nu\rho\sigma} J_\nu^* J_\rho N_\sigma, \quad \gamma_{va} = -\frac{2va}{v^2 + a^2}$$

- If  $\tau$  coupling  $v + a\gamma_5$  and  $m_{\nu_\tau} \neq 0$  is allowed, one has to add to  $\omega$  and  $H_\mu$ :

$$\hat{\omega} = 2 \frac{v^2 - a^2}{v^2 + a^2} m_\nu M (J^* \cdot J)$$

$$\hat{H}^\mu = -2 \frac{v^2 - a^2}{v^2 + a^2} m_\nu \operatorname{Im} \epsilon^{\mu\nu\rho\sigma} J_\nu^* J_\rho P_\sigma$$

**Formfactors secret life**

The studies within collaborations often rely on private form-factors, wealth of versions were/are regularly created for more general, or specific purposes. I have seen some.

**Arrangements for multidimensional fits with MC.**

- for two hadron final states fits are easy, for three, one can separate contributions of different resonances chains using angle dependent projection operators ( J. H. Kuhn, E. Mirkes Z.Phys.C 1992), but loss of sensitivity and systematic errors. For more hadrons nobody even tried. Too many interferences ...
- For each tau decay calculate vector of weights for alternative decay models
- Choose the best one comparing simulated sample with data. **If dependence is linear in current it is quadratic in weight. Fit function can be analytical all over parameter space. Otherwise linearization/iteration necessary.**
- Arrangement works for TAUOLA standalone and also for KKMC as installed in Belle software. *Thanks to A. Bozek for help.*
- First result point to control of relation between model assumptions and unitarity.
- Exact phase space brings consequences. Unitarity discipline is a must:

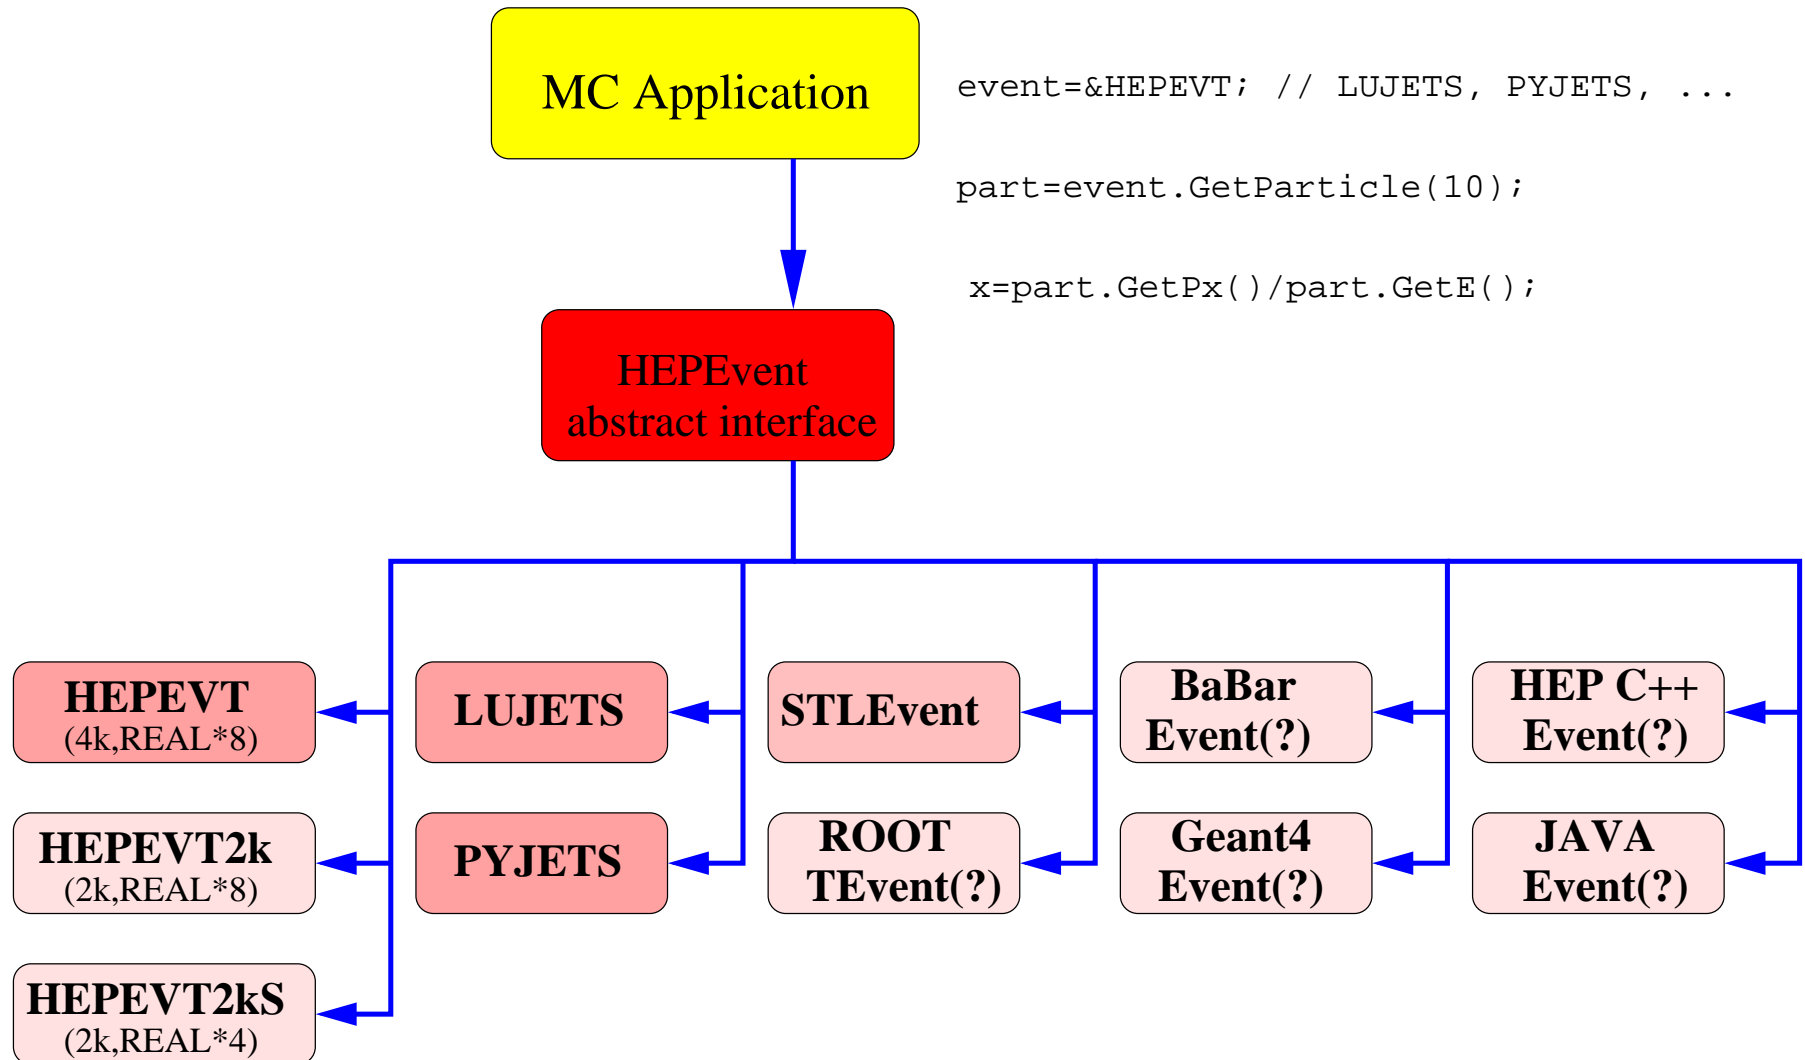

Technical test from the work with V. Cherepanov. Good teaching example.  $\rho$  system propagator has to have proper phase space dependent width,  $\tau \rightarrow \eta\pi\pi\nu$ .

**MC-TESTER was developed to automate comparisons**

- It was essential in our work on TAUOLA, and we expect it to be even more essential in the future, also for debugging.
- The same is true for our projects on PHOTOS developments.
- necessary tool for migration from Fortran to C++ .
- Now installed in ATLAS collaboration ATHENA system and used by LCG MC group at CERN.
- Thanks to P. Golonka, T. Przedzinski and N. Davidson for efforts!
- Now we can use it with C++ HepMC event record and all C++ generators as well.

This tool can be used for any MC storing events in standard common blocks: **HEPEVT**, **PYJETS**, ... It may also be extended to adopt new event-record data-structures (i.e. in C++). Recent attempt to have standard: T. Sjostrand et al. A standard format for Les Houches Event Files, hep-ph/0609017. Is it going to be useful and accepted (**this time**)?

## MC-TESTER RESULTS

Here you will find some of the MC-TESTER output comparing various Monte-Carlo Generators. To expand this list, we encourage you to share MC-TESTER validation results or suggestions.

Click on the pdf files in the comparison matrix to get the results booklet.

Click on the generator name to get the ROOT output file from the generation step of MC-TESTER.

### Tau Decay Results

Note: The ROOT files were produced with ROOT Version 5.18, histogram range 0-2 GeV in 60 bins. The comparisons were done with User Analysis MCTest01

Generator	<a href="#">Pythia 6.4.14</a>	<a href="#">Pythia 8.1</a>	<a href="#">Tauola - Cleo</a>

### B+ Decay Results

Note: The ROOT files were produced with ROOT Version 5.18, histogram range 0-6 GeV in 60 bins. The comparisons were done with User Analysis MCTest01

Generator	<a href="#">Pythia 8.1</a>
<a href="#">EvtGenLHC 5.15</a>	<a href="#">evtgenlhc_vs_pythia_8.pdf</a>

web-page [http://mc-tester.web.cern.ch/MC-TESTER/mc-tester\\_results/results.html](http://mc-tester.web.cern.ch/MC-TESTER/mc-tester_results/results.html) Most of the test results are hidden in Atlas repository. In particular one can find there tests of tau decays in HERWIG Sherpa etc.

## MC-TESTER results for decays of particle $\tau^-$ (PDG code 15).

Piotr Golonka      Tomasz Pierzchala      Zbigniew Was

May 22, 2004

### Results from **generator 1**.

tauola-cleo starting point  
no modifications in any case  
May 19 2004.

- From directory:  
/home/wasm/y2004/TAUOLA-all/nowa-tauola/TAUOLA/tauola-old/demo-standalone/prod
- Total number of analyzed decays: 5000000
- Number of decay channels found: 32

### Results from **generator 2**.

tauola-cleo new version  
new channels installed, brs=\*0.001  
May 22 2004.

- From directory:  
/home/wasm/y2004/TAUOLA-all/nowa-tauola/TAUOLA/tauola-new/demo-standalone/prod
- Total number of analyzed decays: 5000000
- Number of decay channels found: 32 + 8

## 13 Decay Channel: $\tau^- \rightarrow \nu_\tau K_S^0 K^-$

Number of events from generator 1: 114161

Number of events from generator 2: 112908

49

MC-TESTER booklet: Page 49. Run like for installation tests.

MC-TESTER results for decays of particle  $B^+$  (PDG code 521).

Piotr Golonka

Tomasz Pierzchala

Zbigniew Was

April 18, 2008

## Results from generator 1.

EvtGenLHC demo.

- Total number of analyzed decays: 500000
- Number of decay channels found: 12876 + 20016

## Results from generator 2.

Pythia 8.1 demo; p-p at 14 TeV  
gg->bbbar.  $B^+$  decay analysed

- Total number of analyzed decays: 484029
- Number of decay channels found: 12876 + 13012

taken from [http://mc-tester.web.cern.ch/MC-TESTER/mc-tester\\_results/results.html](http://mc-tester.web.cern.ch/MC-TESTER/mc-tester_results/results.html) web page. Nice results for  $B^+$  decays. Compared MC are EvtGenLHC 5.15 and Pythia 8.1. In total 50 k-channels found, 1000+ pages booklet created.

Z. Was

Novosibirsk, September, 2008

**PHOTOS for bremsstrahlung in decays and precision**

E. Barberio, B. van Eijk, Z. Was, Comput. Phys. Commun.(1991) ibid. (1994)

See also: P. Golonka et al. hep-ph/0312240, Comput.Phys.Commun.174 (2006) 818.

P. Golonka and Z. Was hep-ph/0604232 EPJC (2007), G. Nanava and Z. Was hep-ph/0607019 EPJC 2007

- It was developed as single photon emission. starting from MUSTRAAL (F. Berends, R. Kleiss, S. Jadach, Comput. Phys. Commun. (1982)) option for final state bremsstrahlung in  $Z$  decay only.
- Factorization of phase space for photonic variables and two-body decay phase space was studied. Similarly for matrix element: process independent kernel was found. Phase space is exact.
- Interference between emission from  $\mu^+$  and  $\mu^-$  is dropped and re-introduced later.
- The algorithm of the antenna type was created: full phase space NLO ready
- Works for single emission (orthodox ME Monte Carlo)
- Fixed order (up to double emission), useful for tests with second order ME.
- Fixed order (up to quadruple emission) or multiphoton.
- Nice environment to study options of factorization schemes, relations between exponentiation structure function evolution, etc.

**PHOTOS**

- Generally kernels in PHOTOS, are not better than LL. To improve, process dependent weights are needed. **Complications for users, but otherwise straightforward!**
- Special weights with complete matrix elements are available now for:  $Z \rightarrow \mu^+ \mu^-$  (2005), and for  $B^+ \rightarrow K^+ \pi^0$ ,  $B^0 \rightarrow K^+ \pi^-$ , etc. (2006), for  $B^0$  and  $B^\pm$  decays – scalar QED)
- $W \rightarrow l\nu$  (2008)
- We will see that effects are small, it is sufficient to keep them for tests only.
- Lots of numerical tests.
- For other decay modes such exercises easy to repeat, if matrix elements are available.
- As consequence: PHOTOS is ready for improvements with measured data as well!
- PHOTOS uses mother-daughter relations in HEPEVT.
- C++ version is prepared but not distributed, need to migrate to HepMC event record.
- Program analyze whole event record and may add bremsstrahlung at any branching.
- Appropriately modifies particles momenta of the whole cascade!
- **Algorithm is vulnerable on the way *how* HEPEVT is filled in. Any new inconsistency and ...**

## Problems With Event Record

1. Hard process
2. with shower
3. after hadronization
4. Event record overloaded with physics beyond design → grammar problems.
5. Here we have basically  $LL$  phenomenology only.

*This Is Physics Not F77!*

Similar problems are in any use of full scale Monte Carlos, lots of complaints at MC4LHC workshop, HEPEVRepair utility (C. Biscarat and ZW) being probed in D0.

Design of event structure WITH some grammar requirements AND WITHOUT neglecting possible physics is needed NOW to avoid large problems later.

$Z \rightarrow \mu^+ \mu^-$  standard PHOTOS vs. Matrix Element.

Figure1: Comparison of standard PHOTOS and KORALZ: single photon emission level. On the left hand side the invariant mass of the  $\mu^+ \mu^-$  pair; SDP=0.00534. On right hand side the invariant mass of  $\mu^- \gamma$ ; SDP=0.00296. The distributions for  $\mu^+ \gamma$  are identical to  $\mu^- \gamma$ . The histograms produced by the two programs (logarithmic scale) and their ratio (linear scale, black line) are plotted on both figures. Test1, as defined in Section 3, is used, overall SDP=0.00534, fraction of events with hard photon was  $17.4863 \pm 0.0042\%$  for KORALZ and  $17.6378 \pm 0.0042\%$  for PHOTOS.

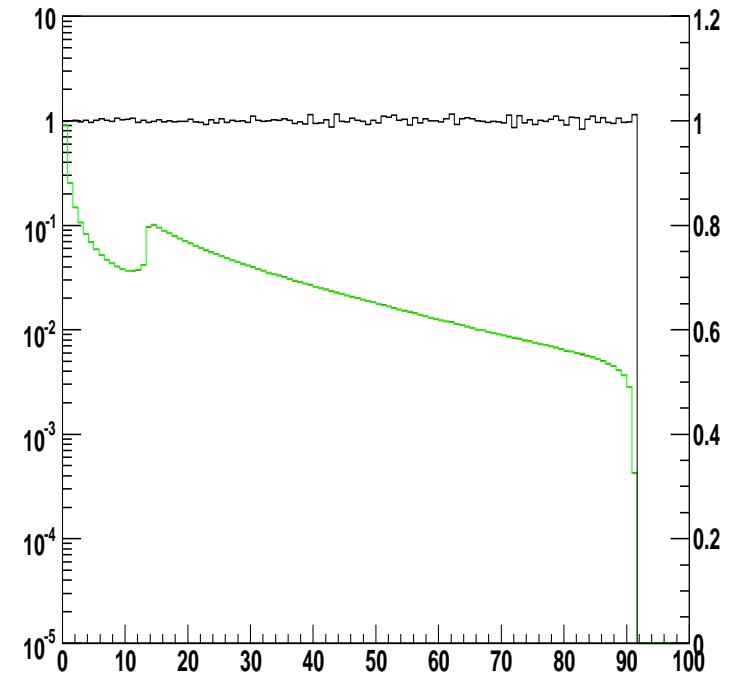

$Z \rightarrow \mu^+ \mu^-$  PHOTOS vs. Matrix Element.

Figure 2 Comparisons of improved PHOTOS and KORALZ: single photon emission level. On the left hand side the invariant mass of the  $\mu^+ \mu^-$  pair. On right hand side the invariant mass of  $\mu^- \gamma$  is shown. In both cases differences between PHOTOS and KORALZ are below statistical error. As in Fig 1 distributions for  $\mu^+ \gamma$  are skipped. Test1, as defined in Section 3, is used, overall SDP=0.0, fraction of events with hard photon was  $17.4890 \pm 0.0042\%$  for KORALZ and  $17.4926 \pm 0.0042\%$  for PHOTOS.

$Z \rightarrow \mu^+ \mu^-$  PHOTOS vs. Matrix Element.  $\gamma, \gamma$  conf.

Figure5: Comparisons of standard PHOTOS with multiple photon emission and KKMC with second order matrix element and exponentiation. Two comparison figures of worst agreement were selected from 2 hard photon configurations. On the left hand side the invariant mass of the  $\mu^+ \mu^-$  pair is shown;  $SDP=0.00918$ . On the right hand side the invariant mass of the  $\gamma\gamma$  pair;  $SDP=0.00268$ . Test2, as defined in Section 3, is used, overall  $SDP=0.00918$ , fraction of events with two hard photons was  $1.2659 \pm 0.0011\%$  for KORALZ and  $1.2952 \pm 0.0011\%$  for PHOTOS.

$Z \rightarrow \mu^+ \mu^-$  NLO PHOTOS vs. Matrix Element  $\gamma, \gamma$  conf.

Figure6: Comparisons of improved PHOTOS with multiple photon emission and KKMC with second order matrix element and exponentiation. Two comparison figures of worst agreement were selected from two-hard-photon configurations. On the left hand side the invariant mass of the  $\mu^+ \mu^-$  pair is shown; SDP= 0.00142. On the right hand side the invariant mass of the  $\gamma\gamma$ ; SDP=0.00293. Test2, as defined in Section 3, was used, overall SDP= 0.00293, fraction of events with two hard photons was  $1.2659 \pm 0.0011\%$  for KORALZ and  $1.2868 \pm 0.0011\%$  for PHOTOS.

Figure 1: Results from PHOTOS, standard version, and SANC for  $B^- \rightarrow \pi^0 K^- (\gamma)$  decay are superimposed on the consecutive plots. Standard distributions, as defined in the text, are used. Logarithmic scales are used. The distributions from the two plots overlap almost completely. Samples of  $10^9$  events were used.

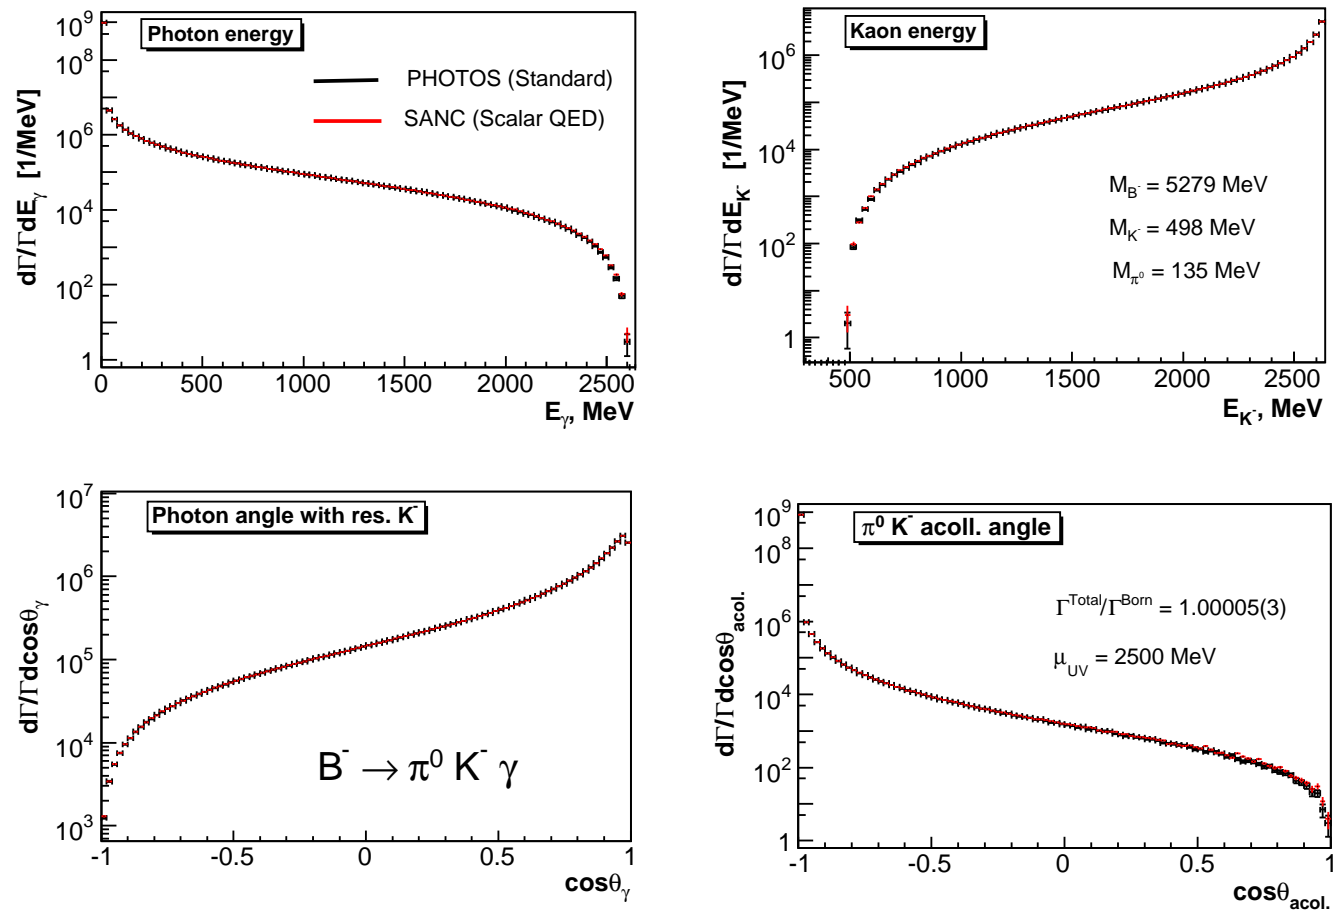

Figure 2: Results from PHOTOS, standard version, and SANC for ratios of the  $B^- \rightarrow \pi^0 K^- (\gamma)$  distribution in fig.1 are presented. Differences between PHOTOS and SANC are small, but are clearly visible now.

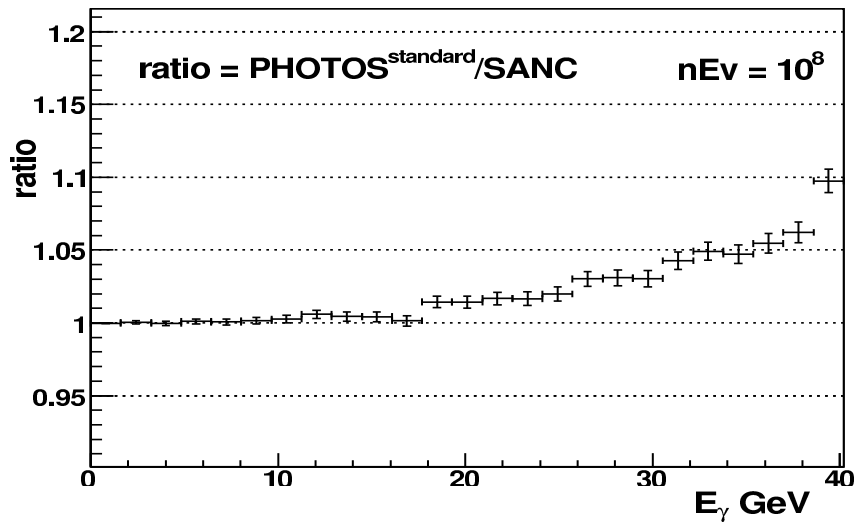

Figure 3: Results from PHOTOS with the exact matrix element, and SANC for ratios of the  $B^- \rightarrow \pi^0 K^- (\gamma)$  distributions. Differences between PHOTOS and SANC are below statistical error for samples of  $10^9$  events.

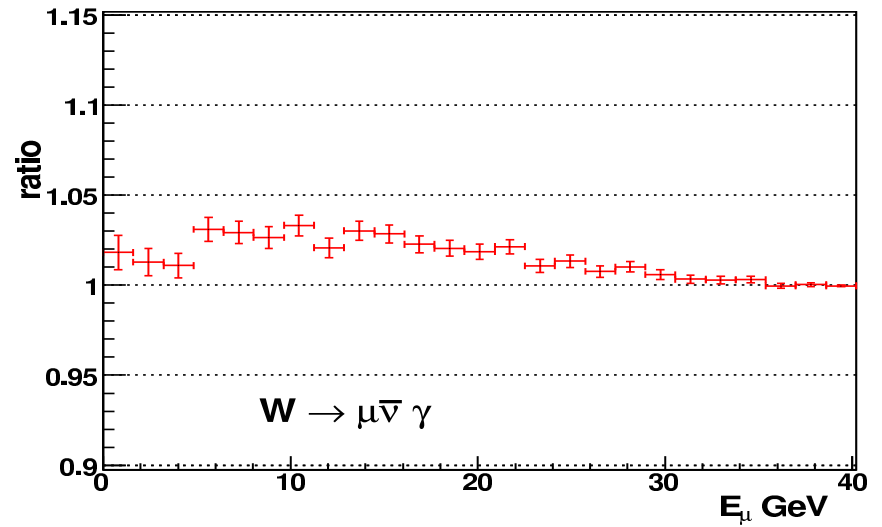

Photon Energy

Muon Energy

Photon Angle

Acollinearity Angle

Results from PHOTOS without any correcting weight, and SANC for ratios of the  $W \rightarrow l\nu(\gamma)$  distributions. Distribution shapes are similar to those of B- decays (and we skip them).

Photon Energy

Muon Energy

Photon Angle

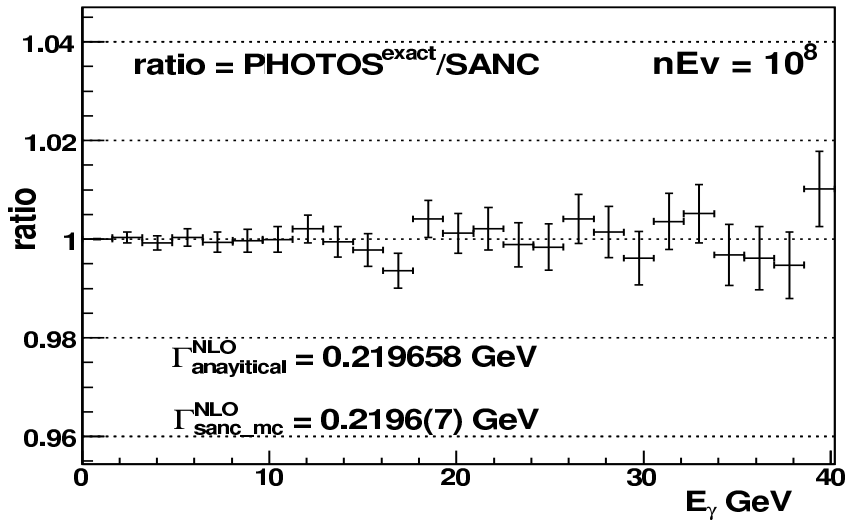

Acollinearity Angle

Results from PHOTOS with the correcting weight of 2003, and SANC for ratios of the  $W \rightarrow l\nu(\gamma)$  distributions.

Photon Energy

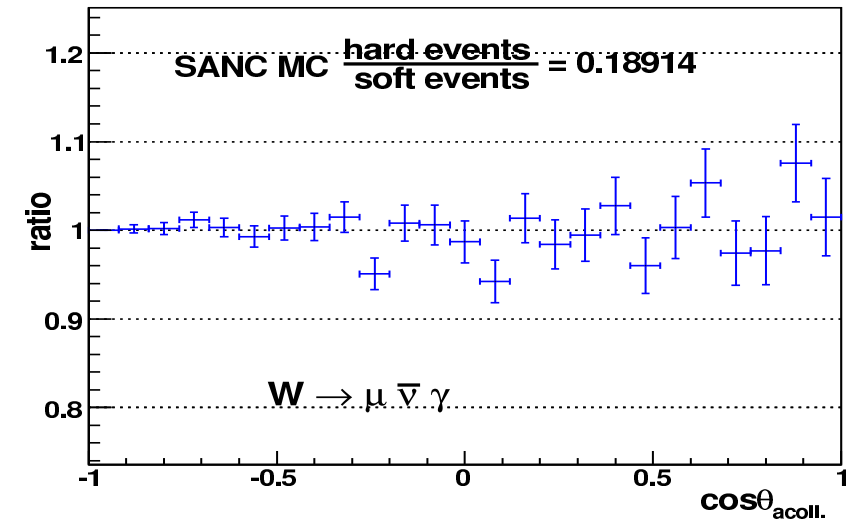

Muon Energy

Photon Angle

Acollinearity Angle

Results from PHOTOS with the exact matrix element, and SANC for ratios of the  $W \rightarrow l\nu(\gamma)$  distributions. Differences are below statistical error of  $10^8$  events..

## Conclusion on PHOTOS

- PHOTOS work excellently for statistical samples of up to  $10^9$  events
- Matrix element used in generation is explicitly localized
- Even though in case of scalars as decay products, results means not much direct progress in itself, possibility to play with measurements of form-factors opens.
- Standard PHOTOS is most probably sufficient for many years to go.
- In case of doubts or 'big' measurements technique of validation is prepared.
- Extensions to QCD is an open possibility now.

# TAUOLA universal interface

- To run, generator for tau decays must be combined with the part for tau production.
- In cases of our packages such as KORALB, KORALZ, KKMC host programs provide environment for TAUOLA use.
- I will concentrate on physics points in case when only information from event records is used.
- I will skip technicalities related to the way how HEPEVT common block is filled in 3 versions of PYTHIA conventions and HERWIG.
- also I will skip new developments in domain of event records.
- TAUOLA universal interface reads information from HEPEVT common block, there  $\tau$  leptons to be decayed are found,
- and their spin states are calculated from kinematical configurations of hard processes leading to  $\tau$ 's.

**Formalism for  $\tau^+ \tau^-$**

- Because narrow  $\tau$  width approximation can be obviously used for phase space , cross section for the process  $f \bar{f} \rightarrow \tau^+ \tau^- Y; \tau^+ \rightarrow X^+ \bar{\nu}; \tau^- \rightarrow \nu \nu$  reads:

$$d\sigma = \sum_{spin} |\mathcal{M}|^2 d\Omega = \sum_{spin} |\mathcal{M}|^2 d\Omega_{prod} d\Omega_{\tau^+} d\Omega_{\tau^-}$$

- This formalism is fine, but because of over 20  $\tau$  decay channels we have over 400 distinct processes. Also picture of production and decay are mixed.
- but (only  $\tau$  spin indices are explicitly written):

$$\mathcal{M} = \sum_{\lambda_1 \lambda_2 = 1}^2 \mathcal{M}_{\lambda_1 \lambda_2}^{prod} \mathcal{M}_{\lambda_1}^{\tau^+} \mathcal{M}_{\lambda_2}^{\tau^-}$$

- Formula for the cross section can be re-written

$$d\sigma = \left( \sum_{spin} |\mathcal{M}^{prod}|^2 \right) \left( \sum_{spin} |\mathcal{M}^{\tau^+}|^2 \right) \left( \sum_{spin} |\mathcal{M}^{\tau^-}|^2 \right) wt d\Omega_{prod} d\Omega_{\tau^+} d\Omega_{\tau^-}$$

- where

$$wt = \left( \sum_{i,j=0,3} R_{ij} h^i h^j \right)$$

$$R_{00} = 1, \quad \langle wt \rangle = 1, \quad 0 \leq wt \leq 4.$$

$R_{ij}$  can be calculated from  $\mathcal{M}_{\lambda_1 \lambda_2}$   
and  $h^i, h^j$  respectively from  $\mathcal{M}^{\tau^+}$  and  $\mathcal{M}^{\tau^-}$ .

- Bell inequalities tell us that it is impossible to re-write  $wt$  in the following form

$$wt \neq \left( \sum_{i,j=0,3} R_i^A h^i \right) \left( \sum_{i,j=0,3} R_j^B h^j \right)$$

that means it is impossible to generate first  $\tau^+$  and  $\tau^-$  first in some given 'quantum state' and later perform separately decays of  $\tau^+$  and  $\tau^-$

- It can be done only if approximations are used !!!
- May be often reasonable, but nonetheless approximations.

*Also in C++*

1. Many young people prefer that language ...
2. Many new LHC generators use C++ HepMC structure to store events ...
3. Universal interface is mostly about helping experimental physicist. It must remain in their hands, but it is not their main worry or work direction.

## C++ Interface to Tauola (first development version)

Description of **Tauola** Interface in C++

Authors:  
Nadia Davidson, Zbigniew Was

### Introduction

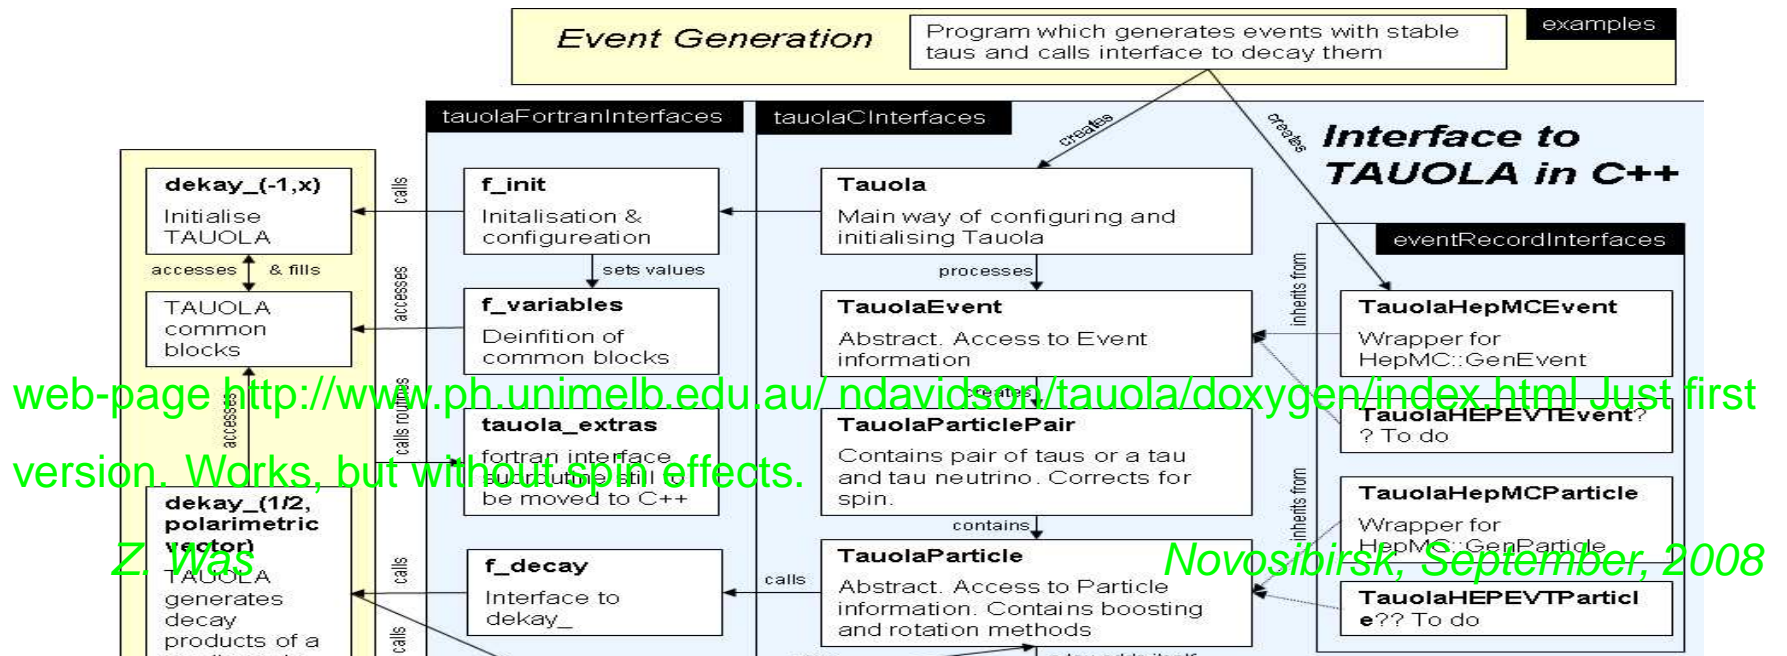

Some description will go here on **Tauola** and the role of the interface

### Example of Use

This gives a description of installing the interface and running the PYTHIA 8.1 and stand-alone examples.

- Firstly download tauola.f from [here](#). I took the version from Oct 11 2005.
- Install it so that there is a file tauola.f in the subdirectory tauola/. You might want to make the demos as well.
- [HepMC 2](#) must be installed.
- To run the PYTHIA example, you also need [PYTHIA 8.1](#) installed. PYTHIA 8.1 must be compiled with HepMC 2 so that the PYTHIA library hepmcinterface exists.
- download and extract [this](#) package for the tauola c++ interface.
- Find the file setup.sh. This must be edited to give the location of PYTHIA, HEPMC and TAUOLA.
  - PYTHIALOCATION should be the path to the base of the /include and /lib directories for PYTHIA 8.1
  - PYTHIA8DATA is the path to the directory containing PYTHIA xml documents (generally it should be "\$(PYTHIA\_INSTALL\_LOCATION)/xml/doc")
  - HEPMCLOCATION should be the path to the base of the /include and /lib directories for HepMC
  - TAUOLALOCATION should be the path to the directory that contains tauola.f. The makefile in the examples directory also assumes that some external fortran code is provided with tauola. eg. photos, jetset. This is true for the version from Oct. 11 2005.
- Type "source setup.sh" to export the paths
- Type "make" to compile the interface libraries.
- Now change into the "examples/" directory and type "make".
- Run the executable "taumain\_pythia\_example.exe". The example will run pythia for 10 events and generate stable taus. Each tau is then decayed with TAUOLA. (No spin effects added yet!). The output of the example is the ascii representation of the HepMC::GenEvent before and after TAUOLA is called.
- A stand alone example is also provided in the "example/" directory. This can be compiled by changing the "MAIN" variable in the Makefile.

### Description of the code

## Summary

- *We have reviewed news on the following tools for simulation of  $\tau$  physics:*
  - *TAUOLA as generator for  $\tau$  decays: additional weights to be used for fits.*
  - *PHOTOS as generator for radiative corrections in decays: new precision results for  $W$  decays.*
  - *benchmark distribution strategies and MC-TESTER now also for C++ applications*
  - *Universal interface of TAUOLA, migration to C++ is on its way*
  - *Uncertainty of total cross section at lower energies as predicted by KKMC is now reduced to 0.3-0.5 %, if appropriate improvements of photon vacuum polarization are installed (S. Banerjee, Phys.Rev. D77:054012,2008).*
  - *stability of C++ event records, need verification still*
  - *encapsulation and inconvenience for end users, problems seem to be under control.*

## Problems With Event Record

1. Hard process
2. with shower
3. after hadronization
4. Event record overloaded with physics beyond design  $\rightarrow$  grammar problems.
5. Here we have basically  $LL$  phenomenology only.

*This Is Physics Not F77!*

Similar problems are in any use of full scale Monte Carlos, lots of complaints at MC4LHC workshop, HEPEVRepair utility (C. Biscarat and ZW) being probed in D0.

Design of event structure WITH some grammar requirements AND WITHOUT neglecting possible physics is needed NOW to avoid large problems later.

### *Future*

- TAUOLA and associated programs seem to be a living project
- As in the past different parametrizations will be developed within collaborations. Also, as in the past, will function as private code. Huge machinery.
- Some “cross talk” may be useful. Non-tau experiments like LHC may profit.
- We have prepared, updated TAUOLA version, with open slots for many new currents to be studied simultaneously.
- High precision of PHOTOS verified for W decays (NLO kernel). We need to enter into phenomenological project where analysis of data is essential.
- Fortran to C++ shift is mainly community issue, technicaly not a problem.
- **Let us have private discussions now.**
